                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention relates to movel isolated cDNAs that are differentially expressed in MYCN activated cells. Specifically, it refers to polynucleotide sequences that exhibit differential expression patterns in cells activated by the transactivator MYCN, where MYCN is a protononcogene that is amplified in neuroblastoma cells and is common in small cell lung cancers. The present invention describes these cDNA molecules as useful for in hybridisation assays to detect expression of nucleic well as for screening assays by identifying molecules or compounds that acids (or complementary nucleic acids) in a present in a given sample, as well as for screening assays by identifying molecules or compounds that specifically bind the cDNA as a ligand and modulate function or activity. Accordingly, these compositions exhibit cytostatic activity and can also be used for gene therapy purposes. This polynucleotide sequence is a cDNA that is differentially expressed in MYCN activated cells, given in an exemplification of the invention. NOTE: This sequence does not appear in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       printed specification but has been obtained in electronic format from US Patent Office at

AAX75770 standard; DNA; 3202 BP.

22-JUL-1999

AAX75770;

and an agent, exposing the cell to the agent and identifying fat cell number or size relative to cells not exposed to the agent. The method also comprises providing an expression vector and an agent, The method comprises providing an expression vector and an agent, exposing the vector to the agent, detecting a change in expression of the gene contains a subject with the agent ovector not exposed to relative to expression of the gene in an expression of the gene comprises an autisense comparises an autisense coligonucleotide. The subject comprises a mammal, preferably a human. The method also comprises providing a polypeptide and a agent, exposing the polypeptide to the agent, detecting binding of the agent to the collypeptide or a change in an activity of the polypeptide, treating a subject with the agent and identifying fat cell number or size in the subject with the agent comprises an antibody. A method of regulating fat cell number or size comprises providing a subject containing fat cells and an agent that changes the expression of a gene, and treating the subject configured the agent conditions so that fat cell size or number in the subject conditions so that fat cell size or number in the capities or conditions so that fat cell size or number or size in the capities or size, for preparing a composition for the condition or preventing or preventing or preventing or preventing compounds that the coll number or size, for preparing a composition for the coll of the co treating or preventing obesity or diabetes. The human cDNA used in the scope of the invention. DDDDDDDDDDDDDDDDDDDDDXX

                                                                                                                                                                                                                                                                                                                                                      10-APR-1997;
                                                                                                                                                                                                                                                                                                15-0CT-1998.
```

This invention describes a novel method for the diagnosis of a disease caused by, or associated with, an RNA molecule that has a frameshift cancer and a wide range of neurodegenerative diseases, especially cancer and a wide range of neurodegenerative disorders (e.g. Alzheimer's disease, Down's syndrome, myotonic dystrophy, Huntington's disease, allown's syndrome, myotonic dystrophy, Huntington's disease, alcoholic liver disease, diabetes mellitus type II cand many others listed) or susceptibility to these disorders. The method allows a definitive diagnosis of Alzheimer's disease in living patients, at an early stage. It is based on the observation that disease may be caused by mutations in RNA rather than DNA. The invention describes the used of neuronal system RNA molecules, specifically proteins including beta-amyloid precursor protein (beta-APP), the microtubule associated protein Z (MAP2), neurofilament-L, microtubule associated protein Z (MAP2), neurofilament-L, meurofilament-F, presenllin I, presenlin II, glial fibrillary acidic protein (GFAP), the cellular tumour antigen p53, B-cell leukemia/lymphoma CC 2 (bcl-2) prote-oncogene, semaphorin III, HUFF-1, high mobility group croces cencedes the wild type and mutant protein fragments represented in AAV21434-Y21520

The present invention describes a method (M1) for screening for an antinoplastic agent. The method involves exposing cells to a chemical agent cobe tested for anti-neoplastic activity, determining a change in expression of at least one gene (I) of a signature gene set, where (I) comprises a sequence (S) selected from 8447 sequences (given in ABL61664 of ABL70110), or is at least 95% identical to (S), where a change in expression is indicative of anti-neoplastic activity, (I) has cytostatic activity and can be used in gene therapy. M1 can be used for screening an anti-neoplastic agent, and can be used for producing a product which is cantinoplastic activity and the data is sufficient to convey the chemical structure and/or properties of the agent. M1 can be used in the treatment of cancer such as colon, breast, stomach, lung, thyroid, oseophageal, ovarian, kidney, prostate or pancreatic cancer, adenocarcinoma, carcinoma, clear cell carcinoma, neuroendocrine carcinoma, papillary carcinoma and Wilm's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Screening for anti-neoplastic agent involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, and determining a change in expression of a gene of a signature gene set.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Horrigan S;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        142
                                                                                                                                                                                                 The invention relates to a novel method for detecting soft tissue sarcoma which comprises obtaining a first soft tissue sample from an individual and a normal soft tissue sample from the same or different individual, determining the expression of a gene in both samples and comparing the expression of the gene in both soft tissue samples, where a higher level of protein expression in the first soft tissue sample indicates the presence of soft tissue sarcoma. The method of the invention has cytostatic applications and may be useful for detecting soft tissue sarcoma, possibly via gene therapy or vaccine production. The nucleic acid sequences may be useful in diagnostic and screening applications. The current sequence is that of a human soft tissue sarcoma-upregulated DNA of the invention. The current sequence is not shown within the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    182

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a method of classifying a breast cancer patient according to prognosis by determining the similarity between the level of expression of each of five genes for which markers are listed in the specification, in a cell sample taken from the breast cancer patient, to control levels of expression for each respective five genes to obtain a patient similarity value. The methods are useful for classifying a breast cancer patient according to prognosis. Kits and computer program products are useful for data analysis using the diagnostic, prognostic and statistical methods of the invention. This sequence corresponds to a marker used in the method of the invention.

This invention describes moved cytoseratic polymucleotide and polypoptice sequences which can be used in a method for diagnosing prostatic cancer. Diagnosis is based on the trisk of developing prostatic cancer. Diagnosis is based on prostatic tissue. Screening for inhibitors of the sequences in prostatic tissue. Screening for inhibitors of the sequences or detection substances involves a binding assay, any compounds that bind are selected, optionally after deconvolution of mixtures. Detection of a predetermined minimum level of the reporter indicates the presence of tumour cells. Inhibitors can be chosen from antisense oligonucleotides, short-interferring RNA or ribozymes; an organic molecule of molecular weight below 5000, preferably 300, that binds to the polypeptide; an organic molecule of molecular aptamer against the polypeptide; a (monoclonal) antibody (Ab) against the polypeptide; a (monoclonal) antibody (Ab) against the polypeptide; a (monoclonal) antibody (Ab) against the polypeptide; a (monoclonal) antibody (Ab) against the polypeptide; a monoclonal) antibody (Ab) against the polypeptide; a monoclonal antibody affected against Ab or any of the above derivatised with a reporter group, cell toxin, immunostimulatory molecules and/or radioisotope. The polymucleotides are identified in human prostatic cancer by differential expression analysis, using DNA microarrays, between normal and tumorous tissues, with (over) expression being detected by quantitative PCR. Analysis of prostatic cancer samples showed that compactatic cancer patients, or subjects at risk, were incubated from prostatic cancer patients, or subjects at risk, were incubated between the diaminobenzidine as collure former (brown). The sequentially but normaliand with hemalum (blue). Malignant cells stained surfaced second antibody; streptavidin-conjugated horseradish cannon manaland with hemalum (blue) of samples were counterstained with member of samples of strongly and prostations and then diaminobenzidine as colour formaliances. adenocarcinoma, membrane and cytoplasmic staining was very strong, and lymph node metastases were also stained. ADR65805-ADR66954 represent the polynucleotide and polypeptide sequences used in the method of the This invention describes novel cytostatic polynucleotide and polypeptide nvention.

This invention describes novel cytostatic polynucleotide and polypeptide sequences which can be used in a method for diagnosing prostatic cancer or the risk of developing prostatic cancer. Diagnosis is based on determining over transcription or over expression of the sequences in prostatic tissue. Screening for inhibitors of the sequences or detection constant the broad are brinding assay, any compounds that bind are substances involves a binding assay, any compounds that bind are selected, optionally after deconvolution of mixtures. Detection of a predetermined minimum level of the reporter indicates the presence of tumour cells. Inhibitors can be chosen from antisense oligonucleotides, short-interfering RNA or ribozymes; an organic molecule of molecular which below 5000, preferably 300, that binds to the polypeptide; an expanser against the polypeptide; a (monoclonal) antibody (Ab) against the polypeptide, preferably humanised or human; an anti-idiotype, non-human (monoclonal) antibody directed against Ab or any of the above derivatised with a reporter group, cell toxin, immunostimulatory molecules and/or radioisotope. The polypucleotides are identified in human prostatic cancer by differential expression analysis, using DNA microarrays, between normal and tumorous tissues, with (over) expression being detected by quantitative PCR. Analysis of prostatic cancer samples showed that CD24 was upregulated in many of them. Sections of tissue, isolated from prostatic cancer patients, or subjects at risk, were incubated

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          142
sequentially with anti-human CD4 murine monoclonal antibodies; blotinylated second antibody; streptavidin-conjugated horseradish peroxidase and then diaminobenzidine as colour former (brown). The samples were counteretained with hemalum (blue). Malignant cells stained strongly but non-malignant cells only weakly. In 15 of 63 samples of adenocarcinoma, membrane and cytoplasmic staining was very strong, and lymph node metastases were also stained. ADR65805-ADR6954 represent the polymucleotide and polypeptide sequences used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              soft tissue sarcoma; cytostatic; gene therapy; vaccine; screening; human;

The invention relates to a novel method for detecting soft tissue sarcom which comprises obtaining a first soft tissue sample from an individual and a normal soft tissue sample from the same or different individual, determining the expression of a gene in both samples, where a higher level of protein expression in the first soft tissue sample, where a higher level of protein expression in the first soft tissue sample indicates the presence of soft tissue sarcoma. The method of the invention has cytostatic applications and may be useful for detecting soft tissue sarcoma, possibly via gene therapy or vaccine production. The nucleic acid sequences may be useful in diagnostic and screening applications. The current sequence is not shown within the specification per se but was submitted in CD format by the inventor.
                                                                                                                                                                                                                                                                                                                                  Early detection of soft tissue sarcoma comprises determining expression of a gene in a first soft tissue sample and a normal soft tissue sample and comparing the gene expression, also useful in treating soft tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  BP; 828 A; 913 C; 843 G; 721 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                Example 2; SEQ ID NO 5926; 210pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a nucleic acid comprising at least 18 bases from a segment of the chemically pretreated DNA of genes associated with metastasis, i.e. any of ADS99709-ADS99906 human genomic sequences or any of the 19 sequences appearing as ADS9991-ADS9992. SEQ ID 2.4,6 etc are the complements of SEQ ID 1,3,5, etc. Also included are an oligomer (particularly an oligomicleotide or peptide nucleic acid) comprising at least one base sequence of at least 9 bases which hybridises to (or is identical with) the sequences referred to above, producing an array of the oligomers on a carrier, obtaining genetic and/or epigenetic parameters for diagnosis and/or therapy of diseases (or predisposition to them) by analysis of cytosine methylation and a kit comprising a bisulphite (disulphite or hydrogen sulphite) and the oligomers. In the

method of above 5-unmethylated cytosines in a genomic DNA sample are converted chemically to uracil, or another base with hybridisation to properties different from those of cytosine, then fragments of the treated DNA amplified (particularly by polymerase chain reaction) using the oligomers and a polymerase (preferably heat stable) to produce the oligomers and any hybridisation detected. The amplicons are labelled with fluorescent or radioactive markers, or with a detachable mass marker to allow their detection by mass spectrometry, specifically using the matrix cassisted laser desorption/ionisation (MALDI) or electrospray techniques. To improve detection in the mass spectrometer, fragments formed in the complement have only a single net charge (positive or neggative). The embedded tissue sample. Oligonucleotides or peptide-nucleic acids that care complementary to (or identical with) parks of the nucleic acids that care complements, and for determining cytosine methylation status and/or single nucleotide polymorphisms in metastasis-related genes. They can be used for analysis of diseases.associated with methylation of CRG and/or therapy of disease.sasociated with methylation of CRG and/or therapy of disease.sasociated with methylation of an analysis and the parks of solid tumours and cancer. The recomplements is human que frament or CDNA associated with

```
fat cell number or size comprising providing a cell that expresses a gene and an agent, exposing the cell to the agent and identifying fat cell number or size relative to cells not exposed to the agent. The method also comprises providing an expression vector and an agent, exposing the vector to the agent, detecting a change in expression of the gene in an expression of the gene that expression vector not exposed to the agent, treating a subject with the agent and identifying fat cell number or size in the subject. The agent comprises an antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Identifying compounds that influence fat cell number or size for treating or preventing obesity or diabetes by exposing the cell to the agent and identifying fat cell number or size relative to cells not exposed to the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    LysserAspGluGlyHisProPheArgAlaTyrLeuGluSerGluValAlaIleSerGlu 82
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to nucleotide sequences which are useful the screening of compounds for the treatment of pain, or for the diagnosis of pain. The nucleotide sequences are up-regulated in the spinal cord in response to streptozocin-induced diabetes. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AlaLeuLeuSerValThrileSerPheArgileTyrLysGlyValIleGlnAlaIleGln

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         102
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          122
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           142
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  162
                     method also comprises providing a polypeptide and an agent, exposing the polypeptide to the agent, detecting binding of the agent to the polypeptide or a change in an activity of the polypeptide, treating a subject with the agent and identifying fat cell number or size in the subject. The agent comprises an antibody. A method of regulating fat cell number or size comprises providing a subject containing fat cells and an agent that changes the expression of a gene, and treating the subject with the agent under conditions so that fat cell size or number in the subject is altered. The method is useful for identifying compounds that influence fat cell number or size, for preparing a composition for treating or preventing obesity or diabetes. This sequence represents mouse cDNA used in the scope of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a novel isolated gene sequence that is down-regulated in the spinal cord in response to streptozocin-induced diabetes, or comprising, hybridising or having at least 80% sequence identity to a sequence whose expression products are kinases, phosphatases, ion channel proteins, receptors, transporters, G-protein coupled receptor proteins, DNA-binding proteins, proteases or enzymes, given in the specification. A gene of the invention has analgesic activity, and may have a use in gene therapy. The gene sequences, vector,

host cell, animal, polypeptide and antibody are useful for screening of compounds for diagnosing or treating pain. The kits are useful for simultaneous, separate or sequential detecting and/or quantifying downregulation of a gene sequence in the spinal cord of a mammal in response to streptozocin-induced diabetes. The compound or pharmaceutical composition is useful as a medicament for treating or diagnosing pain. The present sequence represents a gene of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  42

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention relates to novel, isolated full length human cDNA molecules and the encoded proteins thereof. Specifically, it refers to comba clones obtained by an oligo-capping method, where none of these clones are identical to any known human mRNAs. The present invention describes an immunoassay to identify agonists and antagonists, as well as antibodies, antisense molecules and siRNAs that can all be used to bind to and modulate expression of the CDNA molecules. As such, these molecules are useful for diagnostic markers or therapeutic targets for the various diseases or morbid states. In particular, they are useful in gene therapy for treating osteoporosis, neurological disease, Alzheimer's disease, Parkinson's disease, dementia, short memory and various cancers, as well as for maintaining equilibrium of sense or motor function, and for treating emotional reaction, fear response and panic. Accordingly,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      2053
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               sequences (I). (I) can have cytostatic, immunomodulatory and neuroprotective activities, and can be used in gene therapy. (I) and proteins (II) encoded by then are used in some therapy. (I) and sasays to select DNA molecules, RNA molecules, peptide nucleic acids, mimetics, peptides, proteins, agonists, antagonists, antibodies or their fragments, immunoglobulins, inhibitors, drug compounds and pharmaceutical agents. Expression of (I) in a sample indicates the differentiation of embryonic stem cells into a tissue selected from brain, heart, kidney, liver, lung, skeletal muscle or pancreatic tissues. (I) and (II) are used to produce an expression profile that defines a metabolic or developmental process, treatment, condition, disease or disorder. The gene profile can be used for disgnosis, prognosis or monitoring of treatments and for investigating a predisposition to a disorder where the gene is associated with a cancer, immunopathology or neuropathology
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              103 LeuArgArgLeuPheLeuValAspAspLeuValAspSerLeuLysPheAlaValLeuMet 122

The cDNA was isolated from a Saos-2 (human osteosarcoma cell line) cDNA library. The protein has homology with the human neurcendocrine specific protein C (PIR Accession No. 160904), and may have a similar function. The protein may be used to raise specific antibodies, as assay reagents, as diagnostic tissue markers, for the isolation of cognate receptors, ligands and binding proteins, and as biologically active agents. Nuclectides encoding the protein may be used as primers and probes or antisense molecules, and in gene therapy. Cells transformed with these nucleotides may be used to screen for agonists and antagonists which are potentially useful therapeutically
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        199 ACGCTGATCATGCTGCTTTCCCTGCCTTTCAGTGTCATCAGTGTGTCTTCTTACCTC 258

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an isolated polypeptide having BACE1 activity. The protein is RTM4 or RTM3 protein. The polypeptide is useful in preparing a composition for treating amyloidosis or Alzheimer's disease. This sequence corresponds to the RTM'3 gene.

                                                                                                                           ò
                                                                                                         Cancer-associated nucleic acid molecules (N) and proteins (P), where the cancer-associated nucleic acid molecules (N) and proteins (P), where the proteins are collectively known as colon cancer antigens. The colon cancer antigens have cytostatic activity and can be used in gene therapy and vaccine production. N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing inactive proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer-associated Ps, by inserting the nucleic acids into a host cell and culturing the cell to express the proteins. N and P carcinomas and cancers. Additionally and Additionals. N and P carcinomas and cancers. Additional colorectal sequences used in the exemplification of the present invention. N.B. Pages 666 to 682 and page 7053 of the sequence listing were missing at the color of the process are present for SEQ ID NO:1027

The invention relates to novel human secreted proteins, the nucleic acids encoding them. The protein may exhibit cytokine, cell proliferation or centarion of other cytokines cell differentiation activity or may induce production of other cytokines in certain cell populations and may exhibit immune stimulating or immune suppressing activity, which is useful for the treatment of various immune suppressing activity, which is useful for the treatment of various immune components and disorders e.g. severe combined immunodeficiency (SCID), autoimmune disorders e.g. multiple sclerosis, systemic lupus exthematosia arthritis, autoimmune pulmonary inflammation. The proteins are also useful in the treatment of diseases and disorders combined in graft-versus-host diseases (GVHD), in the induction of tumour immunity, myeloid or lymphoid cell deficiencies, wound healing and tissue repair, in the treatment of burns, incisions and ulcers; as well as in treatment of periodontal disease, osteoporosis or osteoarthritis, mediated by inflammatory processes, disease, Huntington's disease, amylotrophic lateral contral nervous system vessel e.g. stroke, sepsis, inflammatory bowel central nervous system vessel e.g. stroke, sepsis, inflammatory bowel disease, ulcers, bone regeneration. The protein, having activin- or contral nervous system vessel e.g. stroke, sepsis, inflammatory bowel disease, ulcers, bone regeneration. The protein, having activin- or ability of inhibins to decrease fertility in female mammals and decrease spermatogenesis in male mammals. The proteins and nucleic acids are also useful as four supplements. The proteins and nucleic acids are also received any and activity of the invarion of the invarion of the invarion of the invarion of the invarion of the invarion of the invarion of the invarion of the invarion of the invarion of the invarion of the invarion of the invarion of the invarion of the invarion of the invarion of the invarion of the invarion of the invarion of the invarion of the invarion of the invarion of

The invention relates to isolated polymucleotides (ABA90876-ABA90968 and ABA90980) and encoded proteins (ABB55698-ABB55800), especially composed by the polymucleotides SEQ ID NO 16 (ABA908707) contained in proteins SEQ ID NO 16 (ABB55707) contained in cromes bd306-7 and yb8-1 respectively and the clones bd306-7 and yb8-1 respectively and the clones bd306-7 and yb8-1 care deposited with the American Type Culture Collection (ArCO with accession number 98599. The polymucleotides and encoded polypeptides have cycostatic, anti-inflammatory, immunomodulator, vulnerary, cultiammatory activity and acting as cytokine modulators, cand anti-inflammatory activity and acting as cytokine modulators, cand anti-inflammatory activity and acting as cytokine modulators, cand anti-inflammatory fissue growth modulators and/or cadherin guppressors. The polypeptides and polymucleotides are useful in gene therapies, particularly for preventing, treating or ameliorating and corting or fungal infections, autoimmune disorders, cancer, systemic lupus corting infections, autoimmune disorders, cancer, systemic lupus deficiencies; wound, burns, incisions and ulcers, osteoporosis or costeoarthritis; central and peripheral nervous system diseases and controphic lateral sclerosis or systemic inflammations, shock, sepsis corting and controphic lateral sclerosis or stroke; inflammations, shock, sepsis corting and peripheral cardiac infarction or stroke; inflammations, shock, sepsis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             disease; or tumours or cancers, pemphigus vulgaris or pemphigus foliaceus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      345 GTACAGAAGTCAGAAGAAGAGCCATCCATTCAAAGCCTACCTGGACGTAGACATTACTCTG 404

New isolated human polynucleotide and secreted proteins can induce

```
AAZ36228-49 encode bone marrow secreted proteins of human bone marrow stromal cells. The proteins can exhibit cytokine, cell proliferation, or cell differentiation activity (either inducing or inhibiting). They can be used to support colony forming cells or factor-dependent cell lines, to regulate hematopoiesis, and to treat myeloid or lymphoid cell lines, to reficiencies. In addition, they may be used to support the growth and proliferation of erythroid progenitor cells, and to treat various anemias. They can have colony stimulating factor (GSF) activity and can be used to support the growth and proliferation of myeloid cells such as granulocytes, monocytes or macrophages, to prevent or treat myelo.

Cyproliferation of bematoportic stem cells, either in place of or in conjunction with platelet transfusions, to support the growth and proliferation of megakaryocytes and platelets, thereby allowing prevention or treatment of platelet conjunction with platelet transfusions, to treatment of platelet conjunction with platelet transfusions, to treat stem cell disorders, such as aplastic anaemia and paroxysmal nocturnal hemoglobinutia, or to repopulate the stem cell compartment after irradiation or chemotherapy. They can be used for growth or differentiation of bone, cartilage, tendon, ligament, or nerve tissue, as well as for wound healing and tissue repair and replacement, and in the treatment of burns, incisions confunction eartilage and/or bone growth in circumstances where the confunction or confunction or called the anaemia and paroxysmal prophylactic use in fracture and cartilage canding some an application in healing bone fractures and cartilage was enaemial and publication or prophylactic use in fracture
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    140

The protein has bomology with the human neuroendocrine-specific protein (FIR Accession No. 160904), and may have a similar function. The protein may be used to raise specific antibodies, as assay reagents, as diagnostic tissue markers, for the isolation of cognate receptors, ligands and binding protein may be used as primers and probes or antisense molecules, and isolation of cognate receptors, ligands and the protein may be used as primers and probes or antisense molecules, and in gene therapy. Cells transformed with these nucleotides may be used to screen for agonists and antagonists which are potentially useful

```
This sequence represents a nucleic acid molecule designated Gene 92 from the human cDNA clone HAUBLS7 (deposited as clone ATCC 97897 and ATCC 909043) which encodes a secreted human protein. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin FC portion (e.g. AAV59502) for increasing the stability of the fused protein as compared to the human protein only. The invention relates to 186 novel genes and their fragments (nucleic acid sequences: AAV59511-V59812; amino acid sequences AAW7731-W75026) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the presence of mutations in a sample or by generating the presence of mutations in the new polynucleotides. Based on which tissues are described for each of the 186 polynucleotides, based on which hissues they are most highly expressed in (see AAV59511 for
                                                                                                                                                                                                                                                                                                                                                                                                                                                         Ruben SM, Rosen CA, Fischer CL, Soppet DR, Carter KC;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to an isolated protein that is one of 186 human secreted proteins, given in the specification, encoded by one of 309 cDNA sequences also given in the specification, encoded by one of 309 cDNA condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. Disorders which are diagnosed or treated include autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. neoplasms of the breast or liver, cardiovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. corneal infection. The polypeptides can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to subburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The culture of primary tissues, to regenerate tissues and in chemotaxis. The culture of primary tissues, to regenerate tissues and in chemotaxis. Contromerase or decrease storage capabilities, fat content, lipid, protein, carbohydrate, vitamins, minerals, cofactors and other nutritional components. The present sequence represents a cDNA derived from a gene encoding one of the novel human secreted proteins of the invention. Note: This sequence did not form part of the printed specification, but was contend in electronic format directly from USPTO at

```
also discloses vectors, host cells, antibodies, and recombinant methods for producing human secreted proteins. The polypeptide and polynucleotide sequences for the secreted proteins are useful for preventing, treating, sequences for the secreted proteins are useful for preventing, treating, disorders (e.g. leukaemia or breast cancers), wounds, reproductive disorders (e.g. leukaemia or breast cancers), wounds, reproductive disorders, blood-related disorders (e.g. wiskott-Aldrich syndrome or thrombocytopaenia), immunodeficiencies (e.g. wiskott-Aldrich syndrome or thrombocytopaenia), immunodeficiencies (e.g. wiskott-Aldrich syndrome or thrombocytopaenia), incumune disorders (e.g. graft-versus-host disease, within or fungal infections (e.g. AIDS or sepsis), renal disorders (e.g. kidney failure), cardiovaecular disorders (e.g. Angina pectoris, cerebral ischaemia or congenital heart defects), respiratory disorders, unuclogical disorders (e.g. Alzheimer's disease). The polynucleotide or polypeptide may also be used as vaccine adjuvants. ACDB2641-ACDB2950 encode human secreted proteins or their fragments.

ACDB2641-ACDB2950 encode human secreted proteins or their fragments.

C.C. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the USDFTO web site at seqdata.uspto.gov/psipsDIDEntry.html
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           646
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  140
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       706
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              160
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   99/

The invention describes an isolated nucleic acid comprising a sequence having 95 % identity with: a polynucleotide fragment of a sequence not given in the specification, or its allelic variant; a polynucleotide fragment of the CDNA sequence; a polynucleotide sequence encoding a polynpeptide, or its fragment, domain, epitope or species homologue; or a polynucleotide that hybridises under stringent conditions to any one of polynucleotide that hybridises under stringent conditions to any one of medicament for diagnosing, preventing, treating or ameliorating a medical condition e.g., cancer. The sequence encodes a novel human secreted protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          466

                                                                          ò
                               The invention relates to isolated nucleic acid molecules and the human secreted proteins (SPB) they encode. The proteins and nucleic acids may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate SP expression e.g. cancer, haemacopoietic disorders, endocrine disorders, diseases of the immune system, inflammatory disorders and many others. Full details of disorders than may be prevented, diagnosed and/or treated by the above methods are given in the specification. The nucleic acid molecules may be used to produce their proteins. The nucleic acid and it's complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and therefore which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        996

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       patients may be in need of restorative therapy. The SPs may also be used as antigons in the production of antibodies against the proteins and in assays to identify modulators of SP expression and activity. The anti-SP antibodies and antagonists may also be used to down regulate expression and activity. The anti-SP antibodies may also be used as diagnostic agents for detecting the presence of the proteins in samples (e.g. by enzyme linked immunosorbant assay (ELISA)). The present sequence

The present invention relates to a method for diagnosing, or evaluating progression of, a neuromuscular disease. The method comprises detecting modulation of the expression of a product (1) of the RTW (reticulon)3 gene. Differential expression of RTM3 is a specific marker of meuromuscular disease, allowing early diagnosis from readily available muscle biopsies. The method is also useful for determining the efficacy of treatment. The method is also useful for determining the efficacy of treatment. The method is used to diagnose (also to evaluate progression or therapy of) neuromuscular disorders, specifically amyotrophic lateral sclerosis (Abs) and myopathy. Also (1) antibodies specific for isoforms of RTM3 or oligonucleotides (antisense sequences or small interfering RMA) that can block/reduce expression of these isoforms are useful for treating neuromuscular diseases and (ii) cells that express RTM3 are useful in screening for therapeutic agents. The present sequence is a RTM3 DNA sequence used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Diagnosing, prognosing and monitoring neuromuscular disease, particularly amyotrophic lateral sclerosis, comprises detecting modulation of the

Sequences ABB10981-ABB12330 represent 1350 novel human polypeptides, and sequences ABB10981-ABA09574 represent nucleic acids encoding them. The current on also relates to vectors and recombinant host cells comprising a nucleotide of the invention, methods of producing the novel polypeptides of the invention, methods of detecting the nucleotides controlled to a sample, and methods of detecting the nucleotides or polypeptides of the invention have homology to known proteins, thereby giving an insight into their probable biological activities, and hence to polypeptides of the invention by probable biological activities, and hence to potential therapeutic applications. The polypeptides of the invention may have various activities, including cytokine, cell proliferation or cell differentiation activity; activity; issue growth activity; memucopoleists regulatory activity; tissue growth activity; immunoulatory activity; activities, or inhibin-related activities; chemotactic or chemokinetic activities; neeptor or ligand activities; or may be involved in oncogenesis, cancer cell proliferation or metastasis. Comparing on their biological activities; polypeptides and nucleotides of the invention are useful for preventing, treating or amaliorating medical conditions, e.g., by protein or gene therapy. Such conditions include disorders, heamatopoletic disorders (e.g., myebiol or 1 ymmhol, cell or proliferative retinopathy, atherosclerosis, coronary heart disease, proliferative retinopathy, atherosclerosis, coronary heart disease, conditions, e.g., by protein or gene therapy. Such conditions include disorders, changed encoding and ulcers), while those which healing (e.g., of burns, incisions and ulcers), while those with immunomedulatory activities may be used in the treatment of viral, metaling (e.g., of burns, incisions and ulcers), while those when the anipulate stem cells in culture to give rise to neuroepithelia or properties or aucoimmune disease or accidental damage. The polypeptides may be used in the disapones. The p

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention relates to nucleic acid sequences AAF93744 - AAF93916 which encode human secretory or membrane proteins represented by AAB88177 - AAB88419. Included in the invention are primers AAF93917 - AAF94295 and AAF662235 which are used to isolate the cDNA sequences of the invention. The invention also includes methods for the production of antibodies directed against the proteins, and cDNA sequences, which can be used in vaccines. The polynucleotide sequences can be used in gene

therapy. The polynucleotide sequences and the proteins they encode may be used in the prevention, treatment and diagnosis of diseases associated with inappropriate secretory protein/membrane protein expression. The nucleic acids and complementary sequences may also be used as DNA probes in diagnostic assays (e.g. polymerase chain reactions (PCR)) to detect and quantitate the presence of similar nucleic acid sequences in samples. They may also be used to study the expression and function of secretory proteins/membrane polypeptides and their role in metabolism. The polypeptides may be used as antigens in the production of antibodies against them and in assays to identify modulators (agonists and antagonists) of expression and activity. The antibodies and antagonists may also be used as therapeutic agents to down regulate expression and activity. The antibodies may also be used as diagnostic agents for detecting the presence of the polypeptides in samples (e.g. by enzyme linked immunosorbant assay (BLISA). Examples of diseases which may be treated include rheumatoid arthritis and diabetes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               815

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to human neuroencorine specific protein linked gene, hNSPL1, highly expressed in human nerve system. The protein is located in the endoplasmic reticulum membrane of cell, is highly expressed in normal nerve cell and has obvious difference in expression inside glia cell and inside glia cell tumour. It may have important inside glia cell the physiological function of nerve system and in some nerve system disease occurrence. The present sequence represents human neuroencocrine specific protein linked gene, hNSPL1, cDNA.

                                                                                                                                                                                                                                                                                                                                                            This sequence represents a nucleic acid molecule designated Gene 92 from the human cDNA clone HADBL57 (deposited as clone ATCC 97897 and ATCC 209043) which encodes a secreted human protein. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin Fc portion (e.g. AAV59502) for increasing the stability of the fused protein as compared to the human protein only. The invention relates to 186 novel genes and their fragments (nucleic acid sequences: AAV59511-V59812; amino acid sequences AAW74731-W75026) which are useful for preventing, treating or ameliorating medical conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polynucleotides. Specific uses are described for each of the 186 polynucleotides, based on which tissues they are most highly expressed in (see AAV59511 for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      40
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    21 SerteuPheLeuLeuLeuSerLeuThrValPheSerIleValSerValThrAlaTyrIle
                                                                                                                                                                                                                                                             New isolated human genes and the secreted polypeptide(s) they encode useful for diagnosis and treatment of e.g. cancers, neurological disorders, immune diseases, inflammation or blood disorders.

The invention relates to an isolated protein that is one of 186 human secreted proteins, given in the specification, encoded by one of 309 cDNA sequences also given in the specification. The protein is used in a pharmaceutical composition used to prevent, treat or ameliorate a medical pharmaceutical composition used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. Disorders which are diagnosed or treated include autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, or the polypeptides can also be used to aid wound healthelial cell proliferation, to prevent skin aging due to subburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The culture of primary tissues, to regenerate tissues and in chemotaxis. The carbohydrate, vitamins, minerals, cofactors and other nutritional concents of the present sequence represents a cDNA derived from a gene encoding one of the novel human secreted proteins of the invention. Note: This sequence did not form part of the printed specification, but was concent and the concent are concent.

New genes and its encoded prostate cancer antigen proteins, useful for preventing, treating, ameliorating or diagnosing e.g. prostate cancers, thymic hypoplasia, multiple sclerosis, AIDS, angina pectoris or cerebral ischemia.

Claim 4; SEQ ID NO 255; 260pp; English.

The present invention relates to the isolation of novel human secreted proteins and the polynucleotide sequences encoding them. The invention also discloses vectors, host cells, antibodies, and recombinant methods for producing human secreted proteins. The polypeptide and polynucleotide for producing human secreted proteins are useful for preventing, treating, ameliorating or disgnosing medical conditions such as hyperproliferative disorders (e.g. leukaemia or breast cancers), wounds, reproductive clisorders (e.g. haemophilia or thrombocytopaenia) immunodeficiencies (e.g. haemophilia or thrombocytopaenia), autoimmune disorders (e.g. wiskott-Aldrich syndrome or thymic hypoplasia), autoimmuned disorders (e.g. wiskott-Aldrich syndrome or thymic hypoplasia), autoimmuned of thyroiditis), allergies (e.g. sathma), autoimmune of thyroiditis), allergies (e.g. sathma), autoimmune or thyroiditis), allergies (e.g. sathma), critical or bacterial or fungal infections (e.g. AIDS or sepsis), renal disorders (e.g. Aidsorders (e.g. widney failure), cardiovascular disorders (e.g. angina pectoris, cerebral ischaemia or congenital heart defects), respiratory disorders, neurological disorders (e.g. Alzheimer's disease). The parkinson's disease), and inflammations (e.g. Crohn's disease). The colymucleotide or polympeptide may also be used as vaccine adjuvants.

CRACHS2641-ACD82950 encode human secreted proteins or their fragments.

CRACHS2641-ACD82950 encode human secreted proteins or their fragments.

CRACHS2641-ACD82950 encode human secreted proteins or their fragments.

CRACHS2641-ACD82950 encode human secreted proteins or their fragments.

```
fragment of the cDNA sequence, a polynucleotide sequence encoding a polypeptide, or its fragment, domain, epitope or species homologue; or a polynucleotide that hybridises under stringent conditions to any one of the sequences of (a)-(a). The nucleic acid is useful for preparing a medicament for diagnosing, preventing, treating or ameliorating a medical condition e.g., cancer. The sequence encodes a novel human secreted

Isolated nucleic acid molecules encoding human secreted proteins, useful for preventing, diagnosing and treating disorders associated with aberrant expression and activity.

Claim 3; SEQ ID NO 255; 142pp; English.

The invention relates to isolated nucleic acid molecules and the human secreted proteins (SPB) they encode. The proteins and nucleic acids may be used in the prevention, disgnosis and treatment of diseases associated with inappropriate SP expression e.g. cancer, haematopoletic disorders, cancer, haematopoletic disorders, cancer, haematopoletic disorders, cancer, haematopoletic disorders, cancer, haematopoletic disorders, cancer, disorders, and many others. Full details of disorders that may be be concerned, disorders and many others. Full details of disorders that may be proteins. The nucleic acid molecules may be used to produce their specification. The nucleic acid molecules may be used to produce their capacities. The nucleic acid molecules may be used to proteins. The nucleic acid molecules may be used to produce their capacities may be in need of restorative therapy. The SPB may also be used as antigens in the production of antibodies against the proteins and in assays to identify modulators of SP expression and activity. The anti-SP antibodies may also be used as disgnostic and activity. The anti-SP antibodies may also be used as disgnostic agents for detecting the presence of the proteins in samples (e.g. by enzyme linked immunosorbant assay (ELSA)). The present sequence
